TO WHOM IT MAY CONCERN

PeBeKa S.A. has recently encountered a very serious problem with the inflow of water into a deep shaft during its 60-year long shaft sinking activity. At a depth of about 1000 m an unexpected inflow of hot saline water from the rock mass occurred. The quantity of this inflow made further sinking of the shaft impossible and the condition to start sinking again was to stop or significantly reduce the water inflow to the shaft.

An agreement was made with Sovereign Hydroseal Pty Ltd. and, after the organizational and technical conditions were agreed, the rock mass was sealed using the methodology and patented Sovereign injections.

The work carried out together with Sovereign was perfectly organized, the import of equipment and injects from Australia and the USA was quickly and precisely prepared.

The cooperation between Polish and Australian specialists was exemplary, the injections were carried out in a professional manner, with the great involvement of Sovereign specialists, and led to the reduction of the inflow of water into the shaft to a level allowing for safe sinking of the shaft in the sealed layers of the aquifer rock mass.

PeBeKa S.A. is very satisfied with the effects of Sovereign technologies and injections and recommends Sovereign to all interested parties as a fully professional company, both in organizational and technical terms, taking care of work safety as well as having a team open to cooperation, full of kindness and sympathy between partners from distant regions of the world.

We wish Sovereign Hydroseal Pty Ltd. many more successes in their professional activities.

Yours sincerely,

Paweł Pawlik

Vice- President of PeBeKa S.A.
